

## The Time Value of Money Equation

The time value of money equation

$$0 = PV + (1 + ip) PMT \left[ \frac{1 - (1 + i)^{-N}}{i} \right] + FV (1 + i)^{-N}$$

establishes the relationships between the following variables:

- N* The number of monthly payments or compounding periods.  
*I%YR* The annual interest rate as a fraction ( $i = I\%YR \div 1200$ ).  
*PV* The present value. (This can also be an initial cash flow or a discounted value of a series of future cash flows.) *PV* always occurs at the beginning of the first month.  
*PMT* The monthly payment.  
*FV* The future value. (This can also be a final cash flow or a compounded value of a series of cash flows.) *FV* always occurs at the end of the *N*th month.

The value *p* indicates payment timing. If  $p = 1$ , then payments occur at the *beginning* of each month. If  $p = 0$ , then payments occur at the *end* of each month. The "TVM" program uses flag 00 to represent *p*. For payments at the beginning a each month, set flag 00. For payments at the end of each month, clear flag 00.

### Note

The correct *sign* (positive or negative) for TVM numbers is essential. The calculations will make sense only if you consistently show *payments out* as *negative* and *payments in* (receipts) as *positive*. Perform a calculation from the point of view of *either* the lender (investor) *or* the borrower, but not both!

Here is how the equation can be written as a program for the Solver:

01 LBL "TVM"	Declares the menu variables.
02 MVAR "N"	
03 MVAR "I%YR"	
04 MVAR "PV"	
05 MVAR "PMT"	
06 MVAR "FV"	
07 1	Calculates the monthly interest
08 ENTER	rate expressed as a decimal frac-
09 ENTER	tion, <i>i</i> .
10 RCL "I%YR"	
11 %	
12 12	
13 ÷	
14 STO ST T	$X = i, Y = 1, Z = 1, T = i$
15 FC? 00	If flag 00 is clear (End mode), cal-
16 CLX	culates ( $i + 0$ ). If flag 00 is set
17 +	(Begin mode), calculates ( $i + 1$ ).
18 R+	Calculates $(1 + i)^{-N}$ .
19 +	
20 RCL "N"	
21 +/-	
22 Y+X	
23 1	Calculates $1 - (1 + i)^{-N}$ .
24 X<>Y	
25 -	
26 LASTX	Calculates $FV (1 + i)^{-N}$ .
27 RCLX "FV"	
28 R+	Calculates $(1 + ip) \left[ \frac{1 - (1 + i)^{-N}}{i} \right]$ .
29 X<>Y	
30 ÷	
31 ×	
32 RCLX "PMT"	
33 +	
34 RCL+ "PV"	
35 END	

**Example.** Penny of Penny's Accounting wants to know what the monthly payments will be for a 3-year loan at 10.5% annual interest, compounded monthly. The amount financed is \$5,750. Payments are made at the end of each period.

After keying in the program above, use the Solver to calculate the unknown information for Penny.

**SOLVER** **TVM** **X: 0.0000**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

Clear flag 00 and set the display format to FIX 2.

**FLAGS** **CF** 00 **X: 0.00**  
**DISP** **FIX** 02 

N	I%YR	PV	PMT	FV
---	------	----	-----	----

Enter the known values:  $PV = 5750$ ,  $FV = 0$ ,  $I\%YR = 10.5$ , and  $N = 3 \times 12$ .

5750 **PV** **PV=5,750.00**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

0 **FV** **FV=0.00**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

10.5 **I%YR** **I%YR=10.50**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

3 **ENTER** 12 **X** **N** **N=36.00**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

Now solve for the payment.

**PMT** **PMT=-186.89**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

The payment is negative because it is money to be *paid out*.

This is \$10 higher than Penny's client can pay each month. What interest rate would reduce the monthly payments by \$10? Add 10 to the negative payment that's already in the X-register and store the new value into **PMT**.

10 **+** **PMT**

**PMT=-176.89**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

Now, solve for the interest rate.

**I%YR** **I%YR=6.75**  

N	I%YR	PV	PMT	FV
---	------	----	-----	----

Return to FIX 4 display mode and exit from the Solver.

**DISP** **FIX** 04 **EXIT** **EXIT** **Y: 6.7509**  
**X: 6.7509**
